Engineered Water Treatment Systems

Integral to water treatment is the movement of the water within the system and no water treatment system will function without a correctly sized and specified pumping arrangement.

Our offering not only covers individual pumps, for direct replacement, but can specify for almost any water moving application.

Our design team can utilise a range of common pump brands such as lowarra or grundfos and can include bespoke control arrangements to meet duty/standby or duty/assist with auto fault changeover function, ensuring complete redundancy for your system.
